# Deployment Foundation

## SDI / ECE / SNC

Implementation:

Python, Ruby Chef DSL

Cross cluster Orchestration

Chef

## ESS

Implementation:

Python, Shell scripts

Cross cluster Orchestration

XCAT

## Cloud

Implementation:

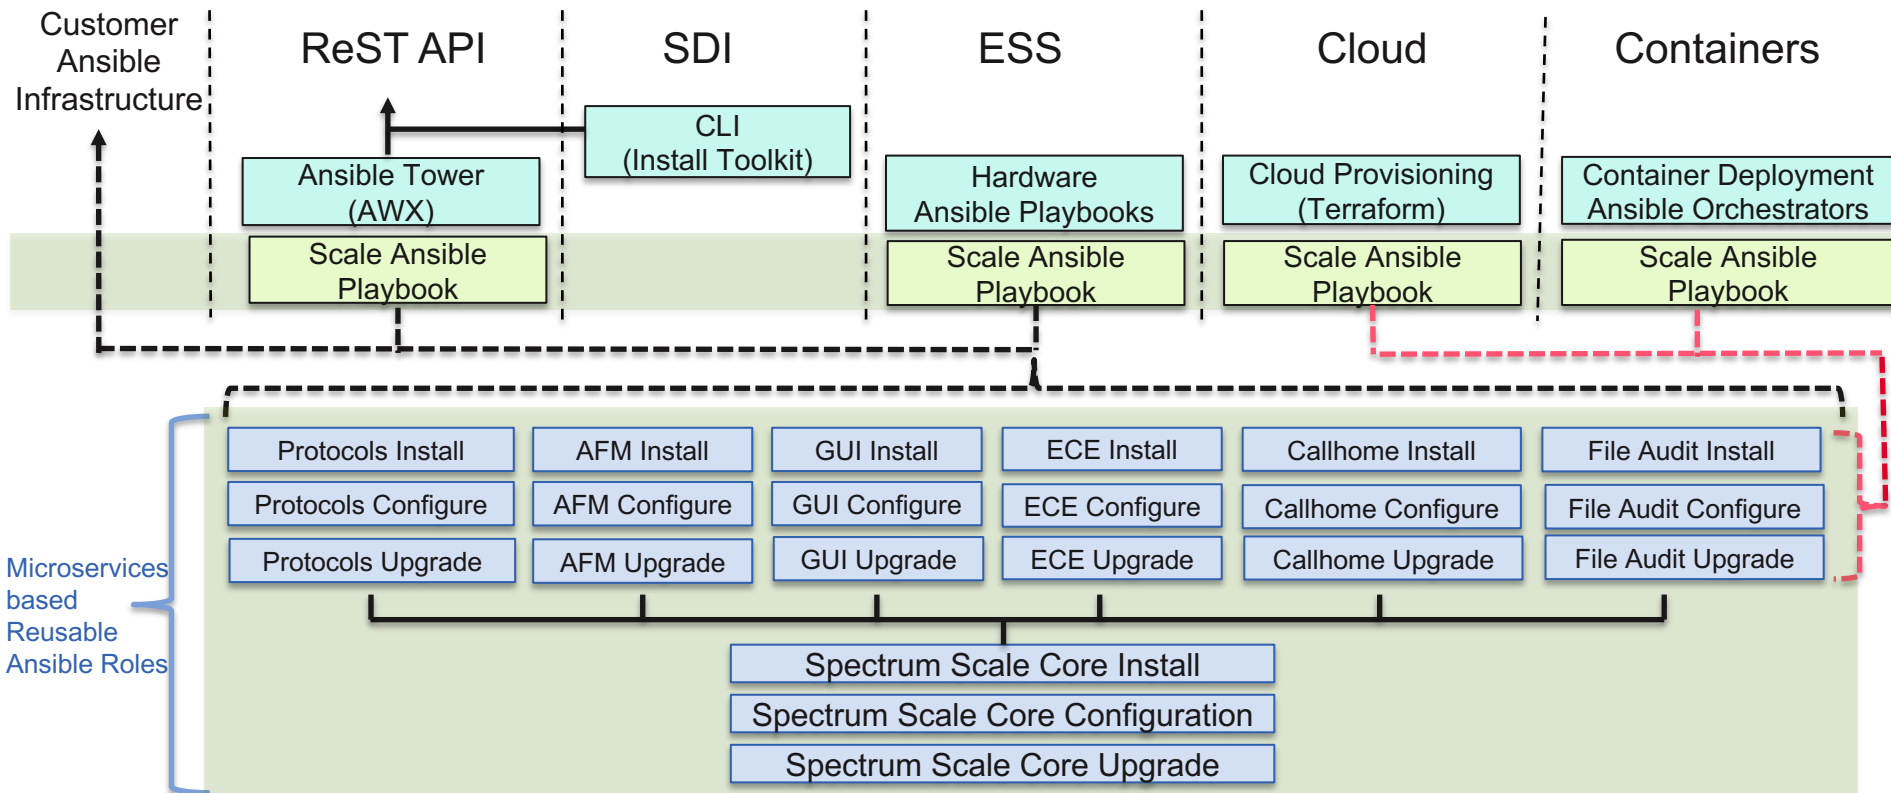

Shell Scripts

Cross cluster Orchestration

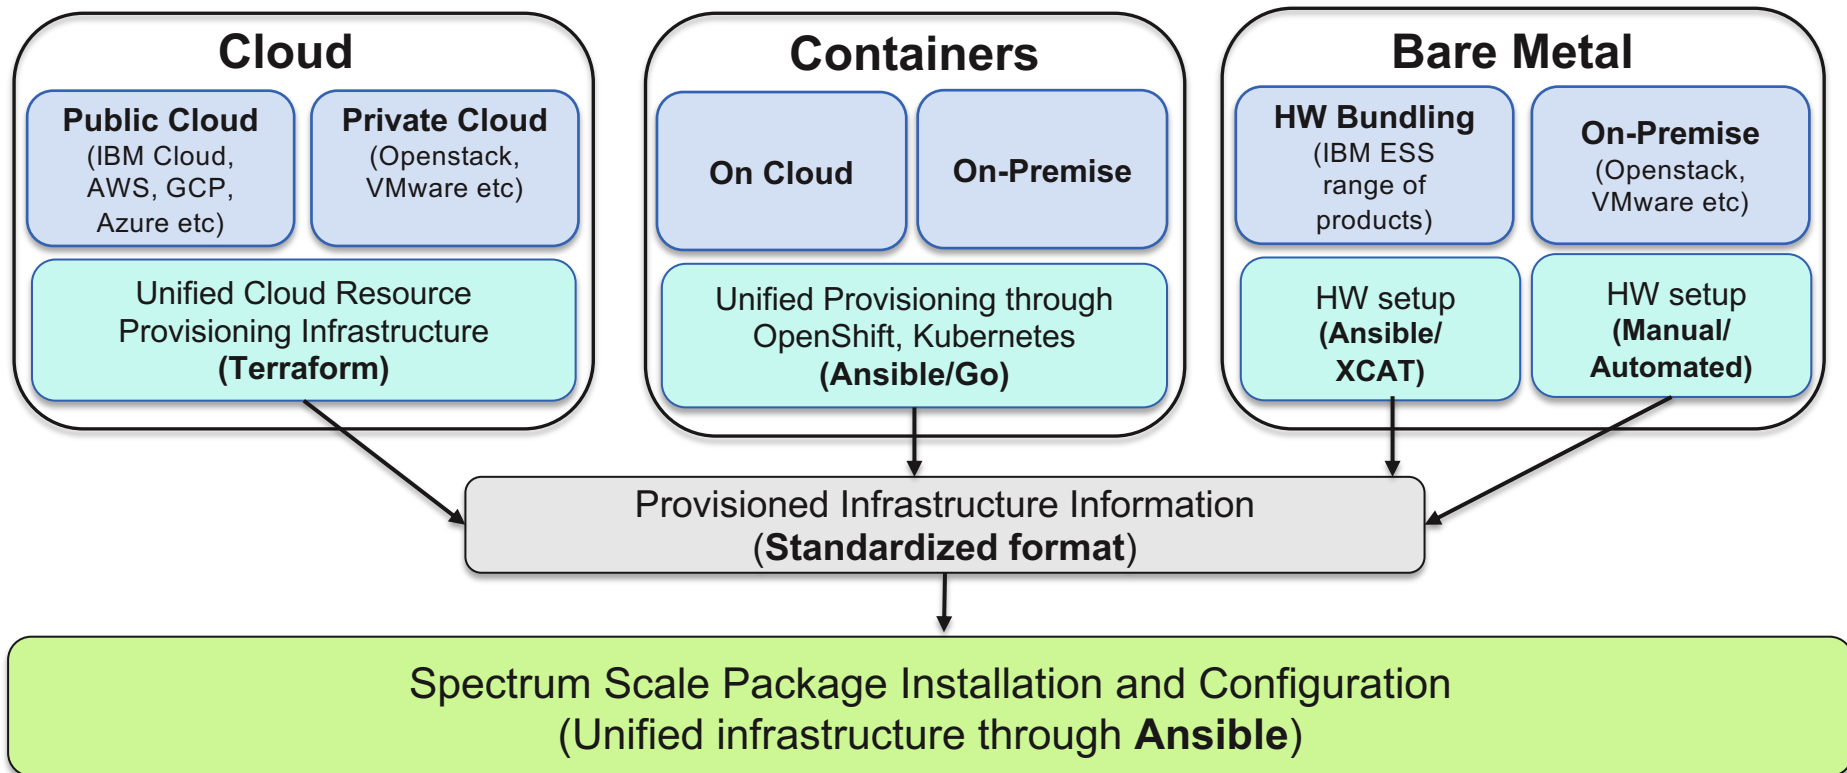

Amazon Cloud Formation

- **Today there are multiple different implementations for the automated installation of Spectrum Scale**
  - A result of differing use cases and needs
  - Non availability of a unified mechanism
  - Implementations rely on wrapping mm commands and build business logic around install and configuration
- **Scale Install automation is not reusable**
- **Leads to inefficiencies and duplication of effort**
  - When new Spectrum Scale functionality is added, all areas will have to duplicate implementation
  - Fixes in one implementation do not carry over to other areas
  - Implementations are non standard and therefore exhibit different behavior across different implementations. LBS teams have to be aware of implementation specifics.
- **No easy way for customer to integrate and reuse Scale install and configuration automation**
  - No Programmatic Interfaces (API) for easy integration into customer deployment tools

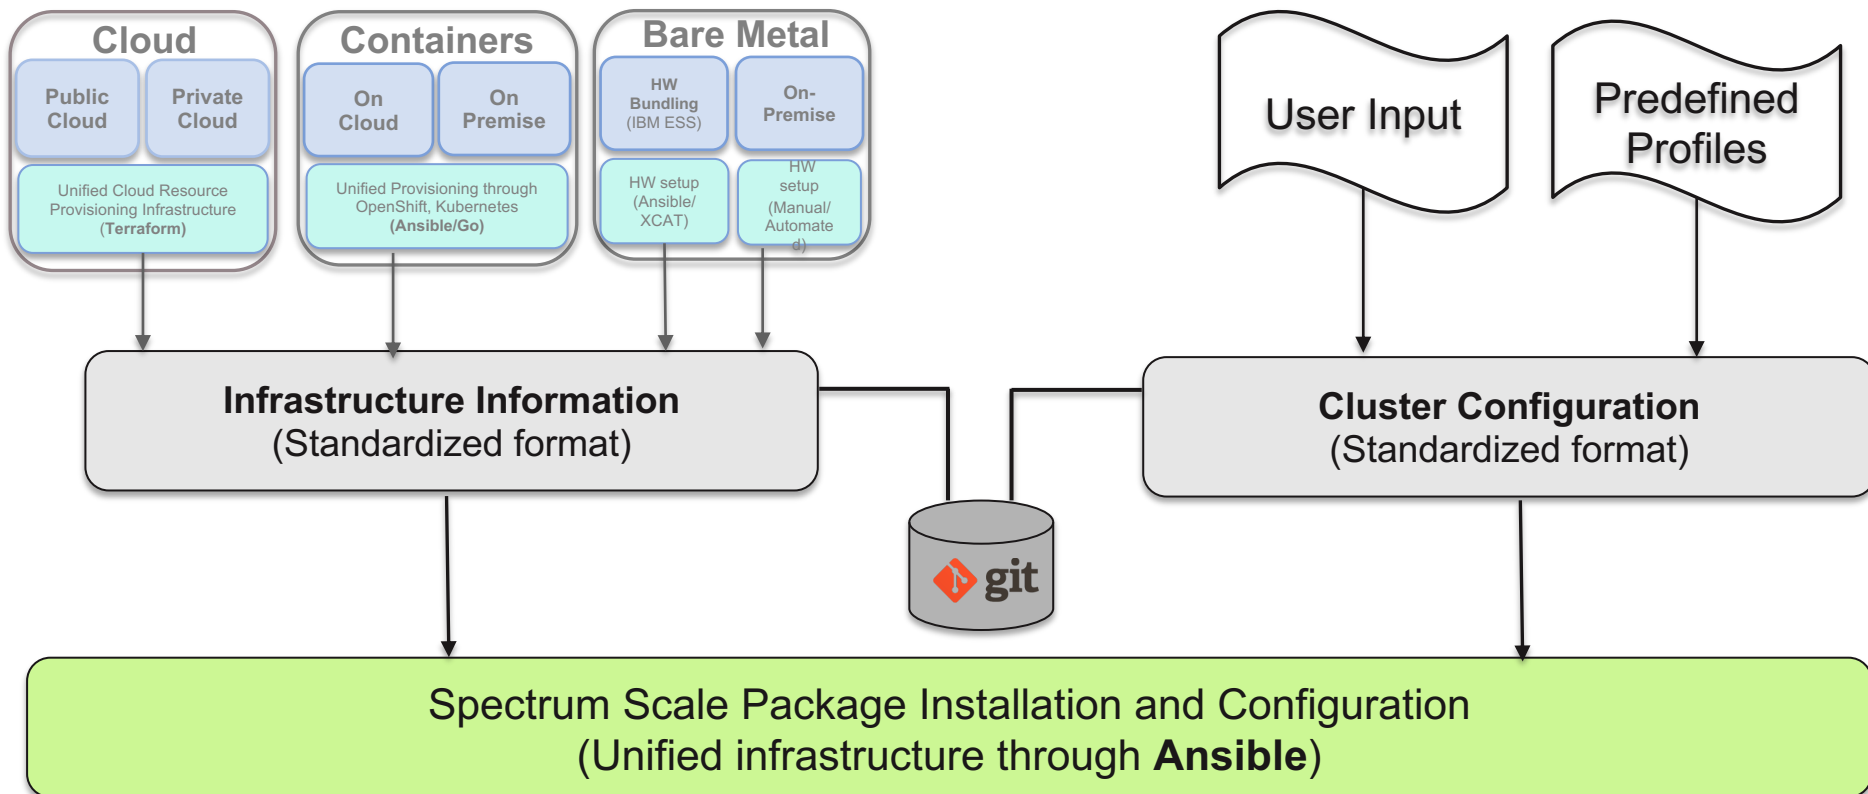

## 1 Microservices based reusable Ansible infrastructure (Provides installation, configuration and upgrade capabilities for all Spectrum Scale form factors)

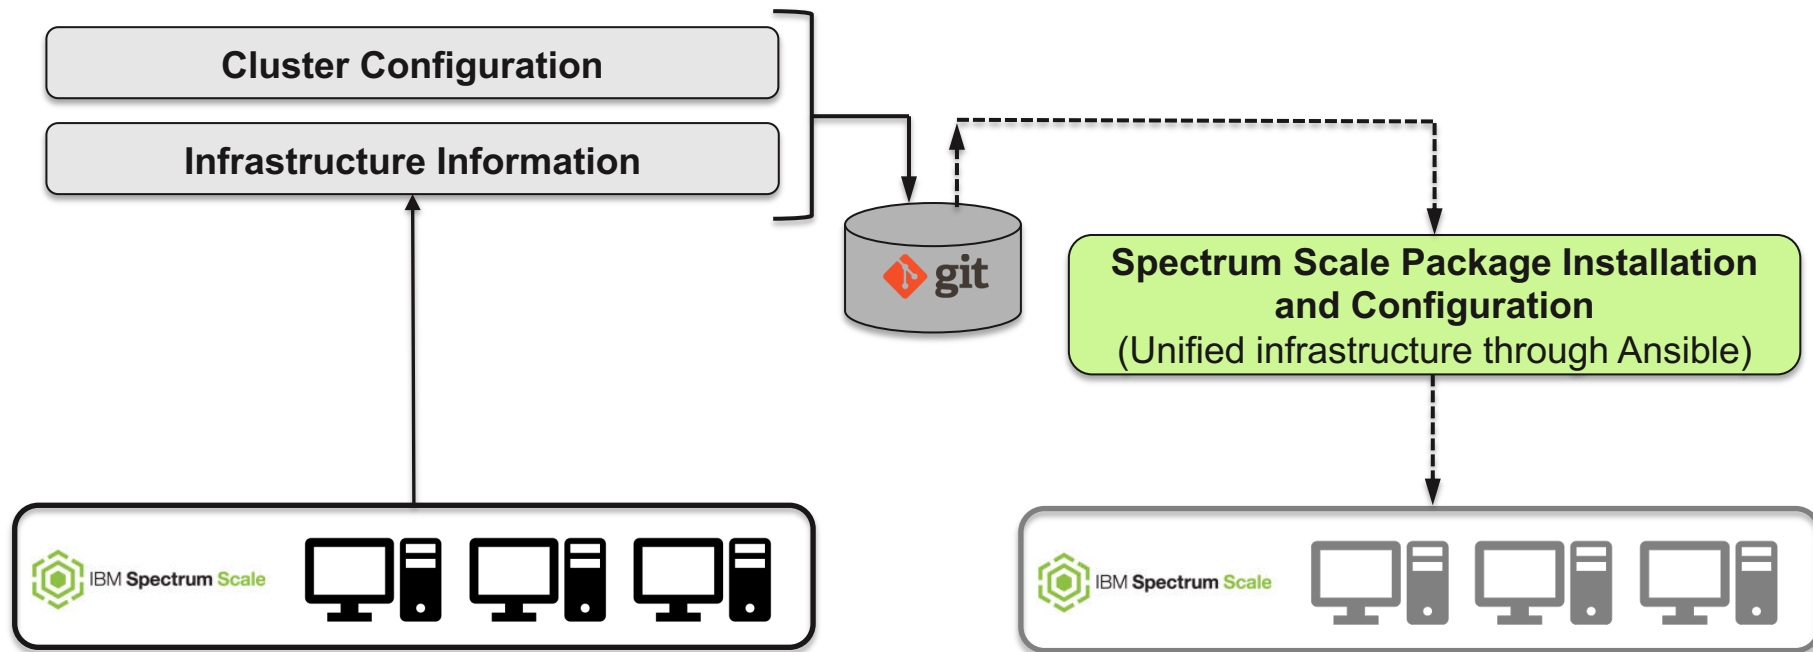

## 2 Infrastructure specific resource provisioning Unified Installation and Configuration through reusable Ansible playbooks

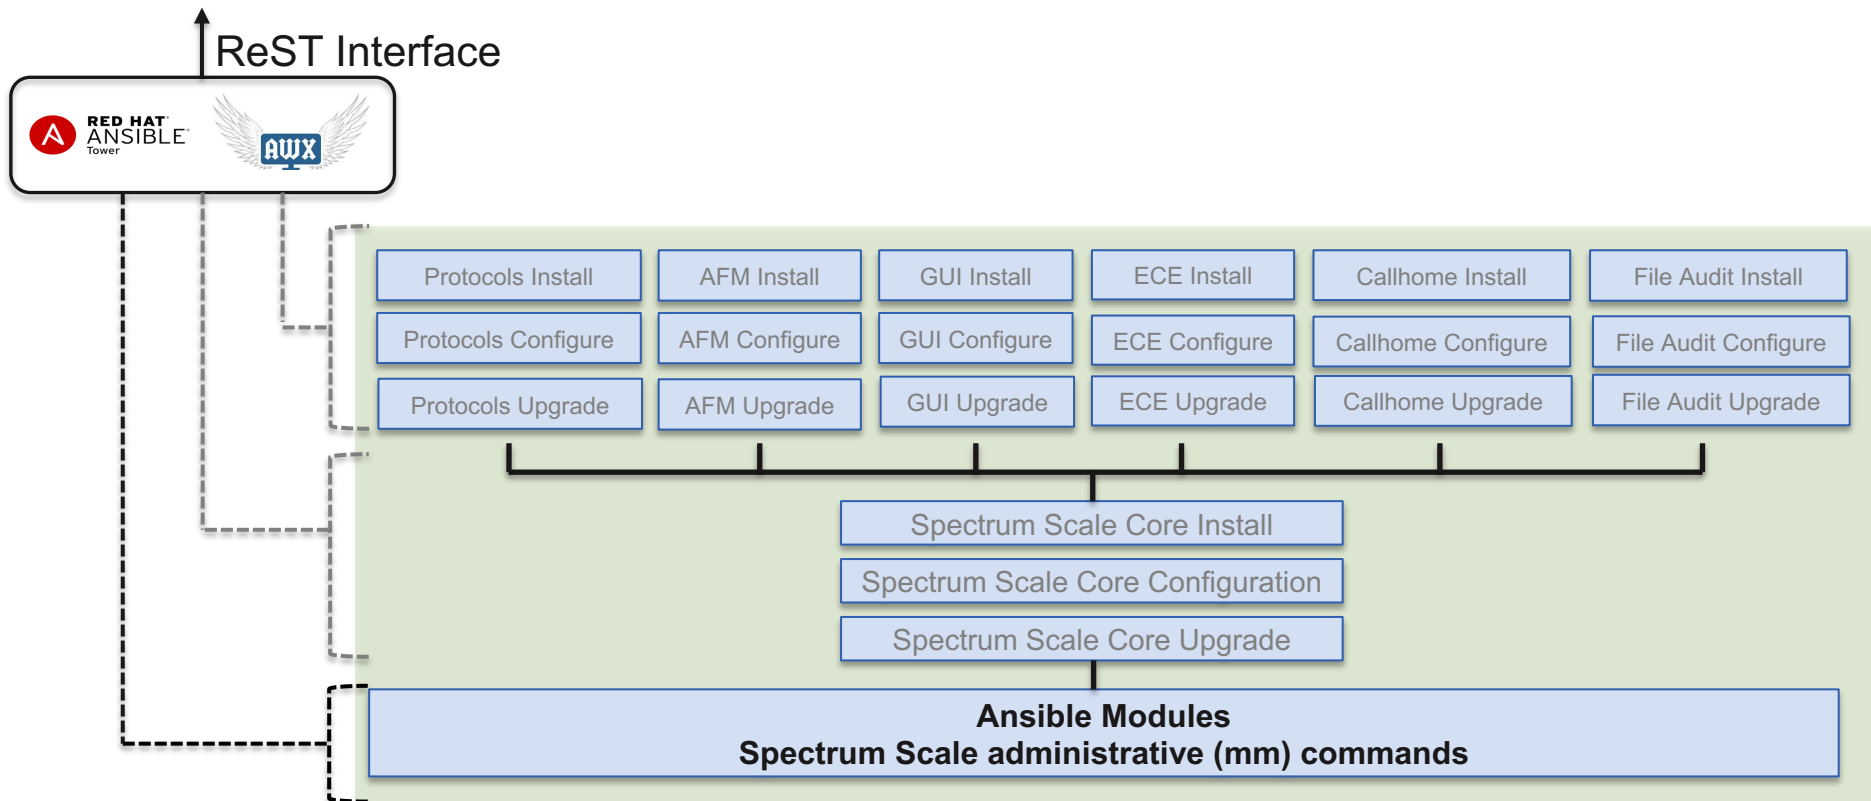

## 3 Cluster and Resource configuration that can be stored, versioned and replayed

- 4 Stored Cluster and Infrastructure configuration can be used to replicate validated and tested configurations from existing clusters to new ones

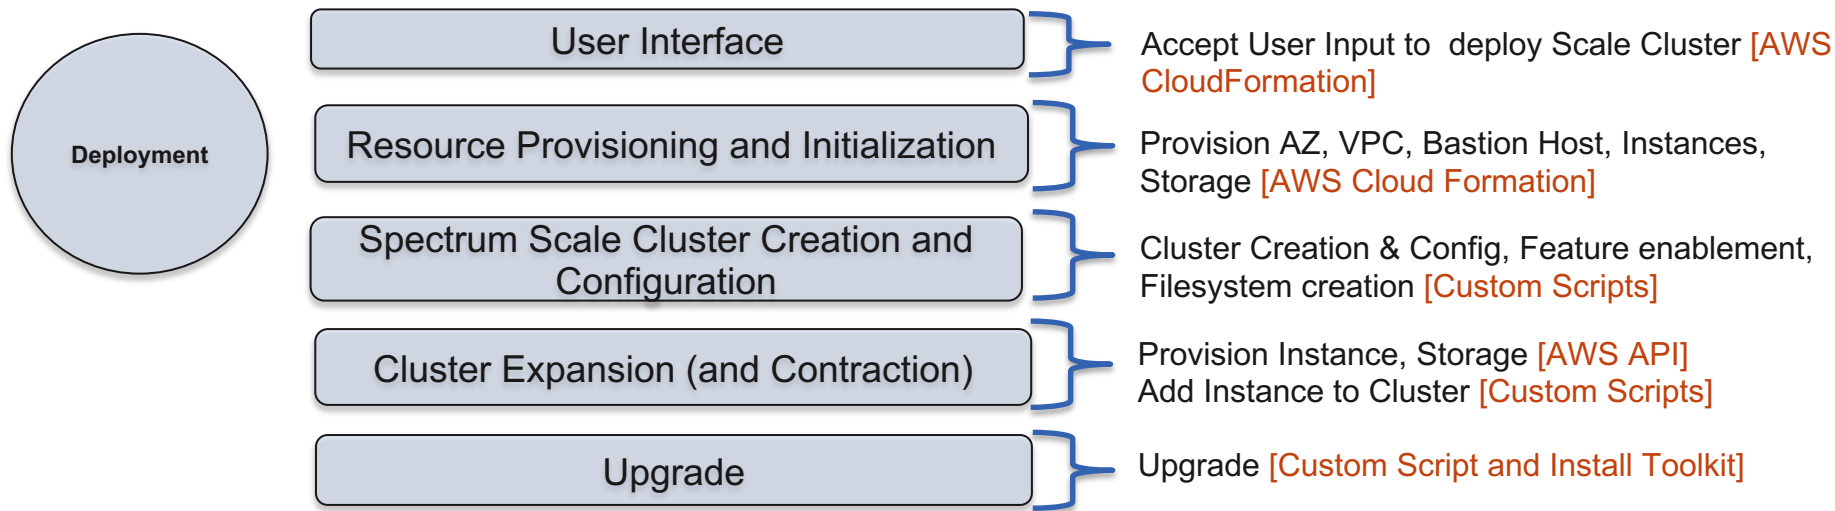

## 5 ReST based Programmatic API access to Spectrum Scale administrative commands and installation, configuration and upgrade playbooks

# Cloud DevOps

- **Scale cloud deployment automation is tightly coupled to Amazon Web Services (AWS) Tooling and Technology**
  - No ability to reuse this automation for other clouds (IBM Cloud, Google Cloud Platform, Azure etc)
  - Requires a complete rewrite of existing automation to enable Spectrum Scale on new Cloud environments
- **Spectrum Scale deployment on AWS relies on pre-created VM images (AMI)**
  - Prevents customers from creating custom AMIs with their applications pre-installed and configured
  - Customers want to pre-create their own AMIs that adheres to their individual security policies
  - AWS Marketplace AMIs are not available with AWS private, Government, Secure Clouds
  - Limited flexibility in choosing instance types
  - No way to mix and match different AMIs in the same cluster (prevents rolling upgrade through replacement of instances with different versions of AMIs)
  - Prevents customers from using deployment automation

**Automated  
Cloud  
Agnostic  
Deployment**

**Automated  
Testing**

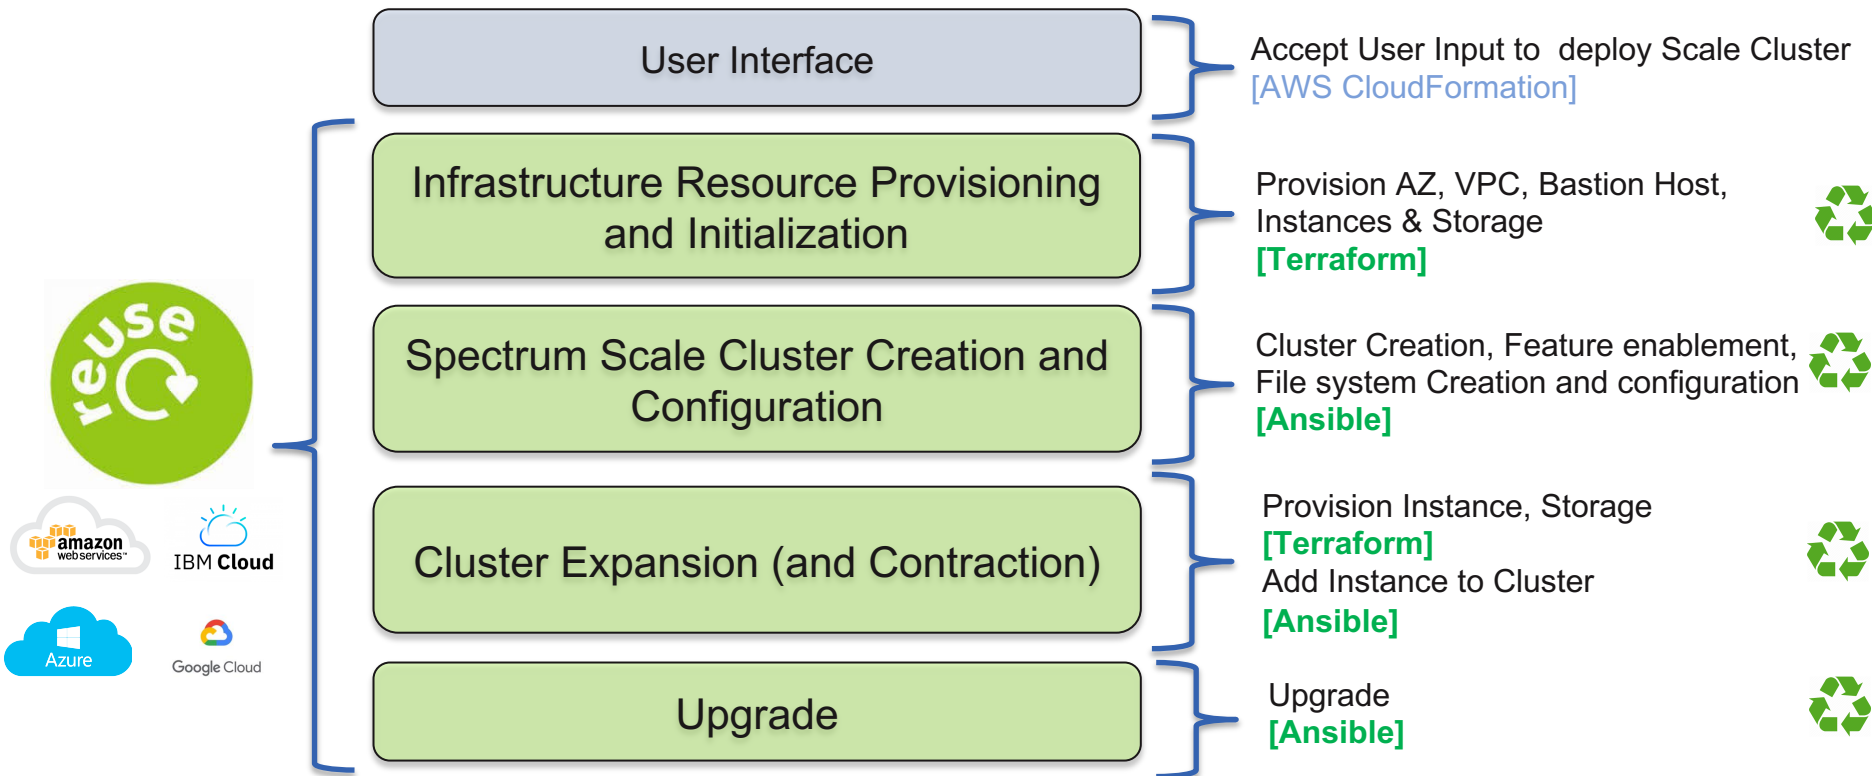

**Consistent  
Support  
Experience**

**Performance  
Tuning &  
Benchmark**

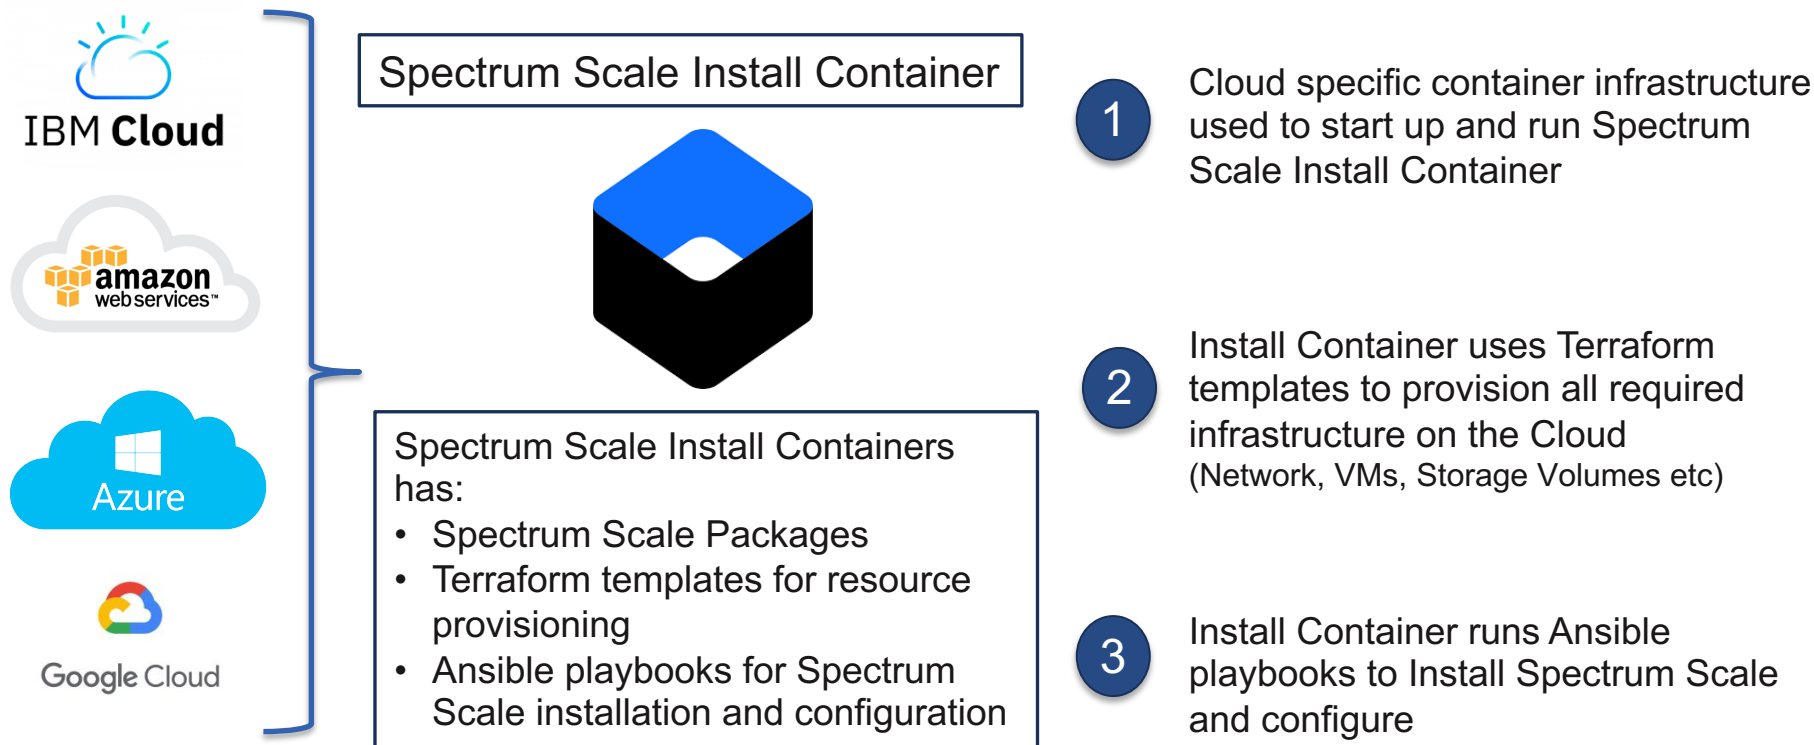

**Certification**

## 1 Cloud Agnostic, infrastructure provisioning through Terraform Cloud Agnostic, Spectrum Scale installation and configuration through Ansible

## 2 Containerized installation and deployment of Spectrum Scale on any Cloud

- Multi cloud deployment
  - Consistent deployment architecture across clouds
  - Reuseable deployment assets that facilitate faster enablement on new cloud environments
    - Cloud agnostic tooling
  - Consistent User interface and experience across clouds
  - Consistent support experience across clouds
  - Faster time to deliver Spectrum Scale automation on new cloud environments
- Allows customers flexibility to create their own custom VM images
  - Customers can pre-create VM images with their workloads and security policies
  - Customers can use the Spectrum Scale cloud deployment automation in Private/Secure Cloud environments (without access to Marketplace)
- Microservices based deployment of Spectrum Scale “advanced” services
  - Automated “on demand” deployment of advanced Scale Services
- Hybrid Cloud enablement
  - Support for remote orchestration of Cloud resource provisioning and Scale deployment
  - Automated deployment of AFM across On-prem and Cloud
  - Enhance Blueprints for easier “on-prem” and cloud connectivity (VPN etc)

- Out of the box automation
  - Rapid automated initial deployment
  - Automated expansion and contraction of cluster
  - Fully automated teardown
  - Support for data archival and retrieval from cheaper Cloud storage
  - Rerun failed deployments
- Governance
- Unification of on-prem and cloud deployment tools
  - Adoption of same deployment infrastructure across all deployments of Spectrum Scale (install toolkit)
- Development efficiency
  - Automated Cloud image creation and verification
